

# Characterization and Fungicide Sensitivity of *Geotrichum candidum* Isolates from the ESVA

Kate Fiedler, University of Hawaii Cooperative Extension

&

Steve Rideout, Virginia Tech Eastern Shore Ag. Research and Ext. Center

# Virginia Tech's Eastern Shore AREC

# Bacterial Spot Screen 2008

## Trial 818

- 1. NTC
- 2. Actigard Standard (0.33 – 0.75 oz/A)
- 3. Actigard Standard Half Rate (0.165 – 0.375 oz/A)
- 4. Actigard Alternating Sprays (0.33 – 0.75 oz/A)
- 5. Actigard Standard Half Rate (0.165 – 0.375 oz/A) + Stimplex
- 6. Actigard Standard Half Rate (0.165 – 0.375 oz/A) + Acadian Exp. 1
- 7. Actigard Standard (0.33 – 0.75oz/A) + Stimplex
- 8. Actigard Standard (0.33 – 0.75oz/A) +Acadian Exp 1
- 9. Actigard Standard (0.33 – 0.75oz/A) alt. Kasumin
- 10. Actigard Standard (0.33 – 0.75oz/A) alt. Kocide
- 11. Actigard Standard (0.33 – 0.75oz/A) alt. Tanos/Manzate/Kocide
- 12. Oxidate

# Tomato Sour Rot – *Geotrichum candidum*

# *Geotrichum candidum*

# Sour Rot Management on ESVA

- Mostly a post-harvest issue, observed mostly in fall after heavy rainfall events – harvest alterations
- Harvest care – prevent bruising on ‘risky’ harvests of green fruit
- Reduce gas to consumer times
- Round > Roma > Grape/Cherry → Grape/Cherry focus in fall
- PH fungicide use – materials containing propiconazole (mostly Chairman – fludioxonil/propiconazole mix)

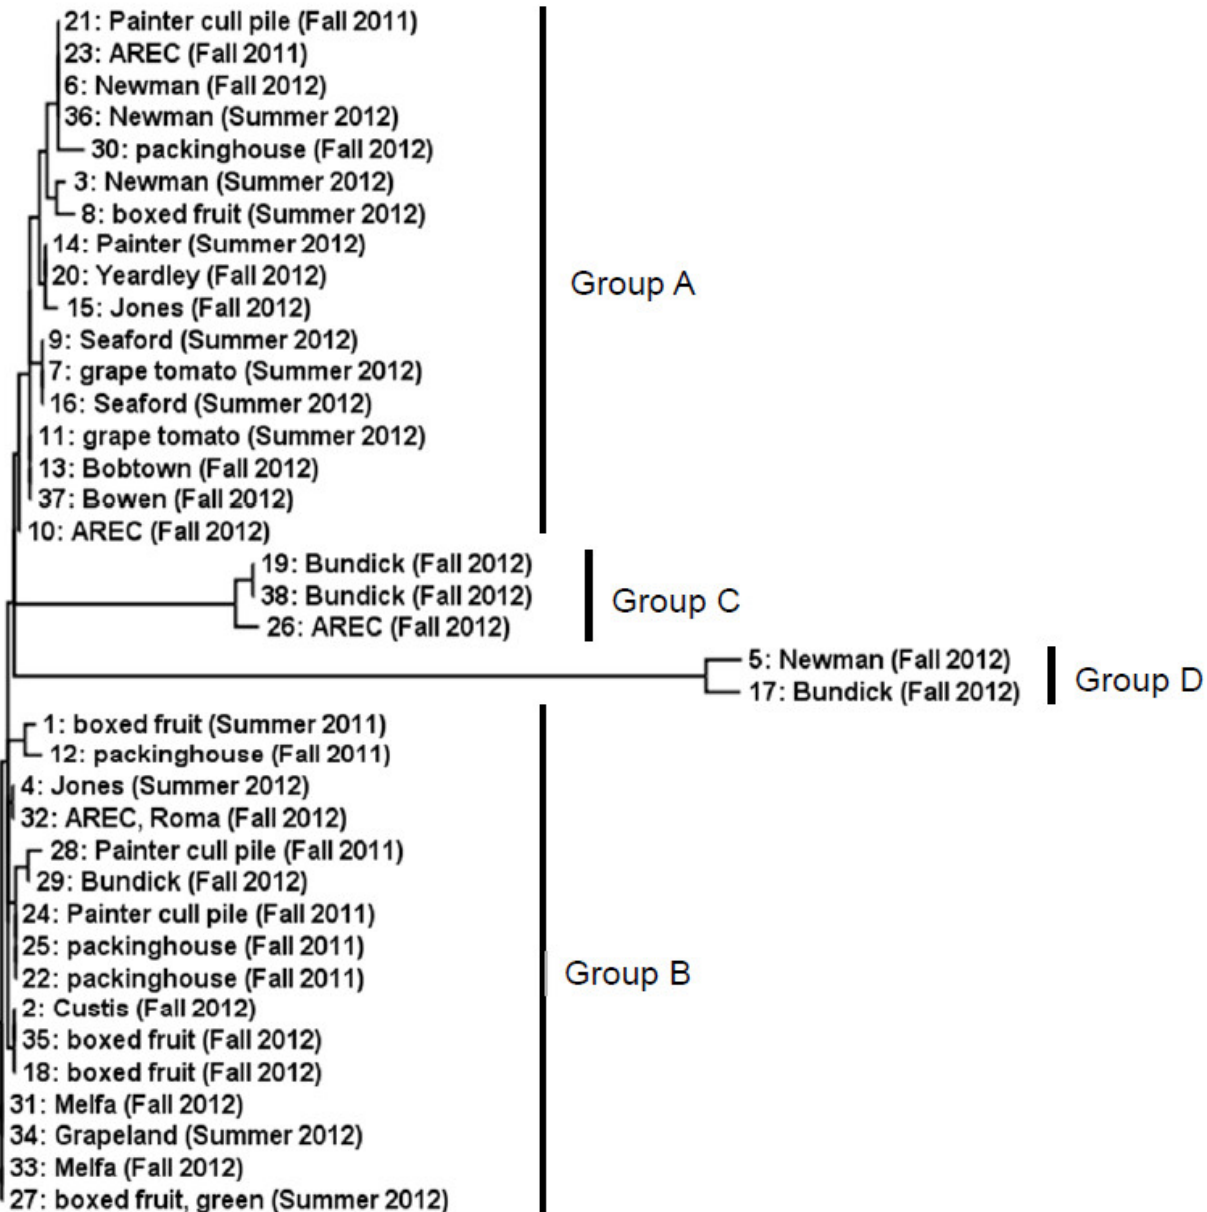

# *Geotrichum candidum* Isolate Collection

- 37 individual isolates from active infection sites on tomato
- Various locations (2011 and 2012)
  - Commercial tomato fields
  - Cull piles
  - ESAREC
  - Packed tomato fruit
- Isolated on PDA and stored at 8° C until further testing

# *Geotrichum candidum* isolate comparison

- 6 primer pairs used for amplification and sequencing
  - ala1                      gln4
  - edc19                     pgm2
  - erg10                    pgi1
- Aligned using Clustal W
- Neighbor-joining analysis used to produce phylogenetic tree
- Based on Alper et al, 2013

- 4 distinct groups of *G. candidum*
- Group D is more closely related (96% similar) to *Galactomyces reessii*, a free-living yeast
- Potential subspecies for Group C and D

# *In-vitro* Fungicide Analysis

- Conducted on fungicide-amended PDA
- Isolates were tested in triplicate
- High and low concentrations equal the labeled rate for tomato or fruiting vegetable production
- Middle concentration is the mean of the range
- Each isolate was incubated at room temperature for 3 days
- The average colony diameter of each treatment was compared to the average growth diameter of the isolates on control, untreated PDA to obtain average growth reduction by fungicide.

# Fungicide Sensitivity

Active Ingredient	Product Name	Manufacturer
dicloran	Botran 5F	Gowan
azoxystrobin	Quadris 2.08SL	Syngenta
<del>sodium hypochlorite</del>	<del>bleach</del>	
propiconazole	Mentor 45WP	Syngenta
<del>hydrogen dioxide, peroxyacetic acid</del>	<del>OxiDate 2.0</del>	<del>BioSafe Systems</del>
difenoconazole	Inspire Super MP	Syngenta
prothioconazole	Proline SC	Bayer
myclobutanil	Rally 40 WSP	Dow AgroScience
fludioxonil	Scholar Max MP	Syngenta
tebuconazole	Folicur 3.6F	Bayer
<del>hydrogen dioxide, peroxyacetic acid</del>	<del>Sanidate</del>	<del>BioSafe Systems</del>

# Prothioconazole

- Low (top), medium (middle), and high (bottom) concentrations of prothioconazole amended PDA
- Tukey HSD compared means
- Distinct letter show significant differences ( $\alpha = 0.05$ )
- Moderate reduction of growth at all concentrations

# Difenoconazole

- Low (top), medium (middle), and high (bottom) concentrations of difenoconazole amended PDA
- Tukey HSD compared means
- Bars with distinct letter show significant differences ( $\alpha = 0.05$ ).
- All concentrations were effective at inhibiting growth

# Myclobutanil

- Low, medium, and high concentrations of myclobutanil amended PDA
- Differences between isolates were not significant
- Bars with distinct letter show significant differences ( $\alpha = 0.05$ )
- Medium and high rates significantly reduce/eliminate growth

# Azoxystrobin

- Low (top), medium (middle), and high (bottom) concentrations of azoxystrobin amended PDA.
- Tukey HSD compared means
- Distinct letter show significant differences ( $\alpha = 0.05$ )
- Low level of inhibition
- Insensitivity?

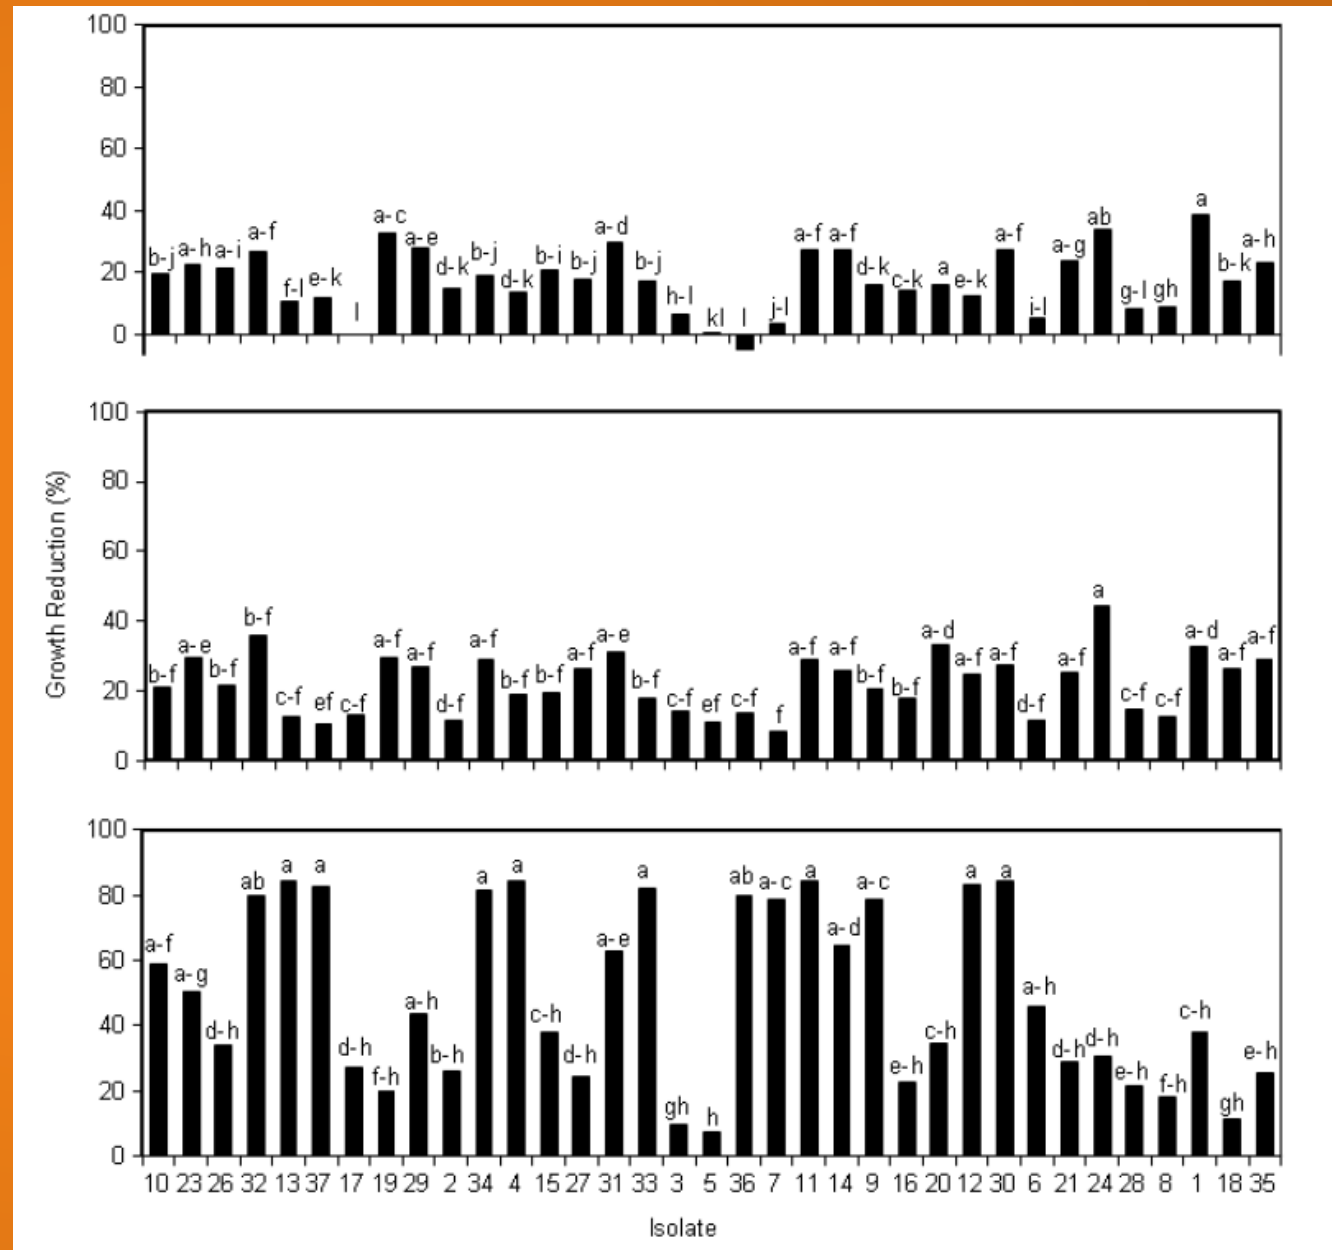

# Dicloran

- Low (top), medium (middle), and high (bottom) concentrations of dicloran amended PDA
- Tukey HSD compared means
- Distinct letter show significant differences ( $\alpha = 0.05$ ).
- High level of control at the highest concentration

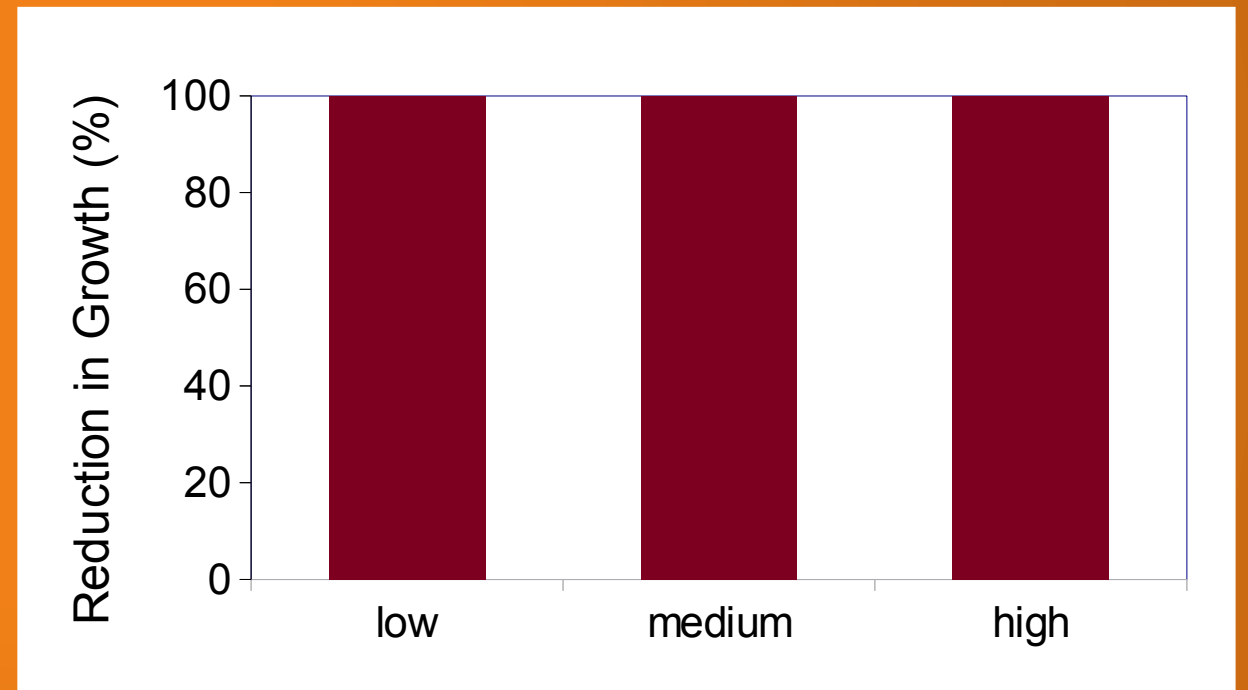

# Fludioxonil

- Low (top), medium (middle), and high (bottom) concentrations of fludioxonil amended PDA
- Tukey HSD compared means
- Distinct letters show significant differences ( $\alpha = 0.05$ )
- Little/no growth reduction at lower concentrations, variable at higher conc.

# Propiconazole & Tebuconazole

- Complete inhibition of growth.
- No statistical differences between concentrations or isolates.

# Conclusions

- Incredibly diverse community of *G. candidum* on ESVA
- All isolates were completely inhibited by propiconazole and tebuconazole
- High level of growth reduction:
  - Difenoconazole
  - Myclobutanil (medium, high)
- Moderate level of growth reduction:
  - Prothioconazole
  - Myclobutanil (low)
- Low/variable/no level of growth reduction:
  - Azoxystrobin
  - Dicloran
  - Fludioxonil
- Sanitizers → Cl and PAA relatively ineffective at 30s exposure times

# Questions?

Steve Rideout, Ph.D.
